## SPECIFICATIONS

### TURNTABLE MOTOR SECTION

<b>Drive System</b>	Direct drive
<b>Motor</b>	12-Pole 24-slot DC Hall motor
<b>Servo-Control System</b>	Switchable: Quartz PLL/FG
<b>Quartz Oscillator Frequency</b>	4.32 MHz
<b>Turntable Platter</b>	31 cm (12-1/4") die-cast aluminum. Weight, 2.4 kg (5 lb 5 oz). Moment of inertia, 350 kg·cm <sup>2</sup> including rubber platter mat, with single stroboscope marks around the turntable skirt.
<b>Strobe Pulses</b>	Excited by quartz crystal oscillator
<b>Wow and Flutter (wrms)</b>	Less than 0.03%
<b>Single-to-Noise Ratio</b>	Better than 73 dB (DIN-B)
<b>Speed Accuracy (Quartz PLL-ON)</b>	±20 ppm
<b>Deviation Under Load (Quartz PLL-ON)</b>	No deviation in speed for loads under 600g·cm (Quartz PLL-OFF) 0.003%/g·cm
<b>Fine Speed Adjustment (Quartz PLL-OFF)</b>	±3%

### TONEARM SECTION

<b>Arm Type</b>	S-type static balance arm with gimbal supports
<b>Tonearm Length</b>	320 mm (12-5/8")
<b>Tonearm Effective Length</b>	232 mm (9-1/8")
<b>Overhang</b>	16 mm
<b>Sensitivity</b>	Vertical, 3 mg; horizontal, 5 mg
<b>Tonearm Stand Base</b>	Diecast zinc
<b>Anti-Skating Device</b>	Counterweight and strung roller

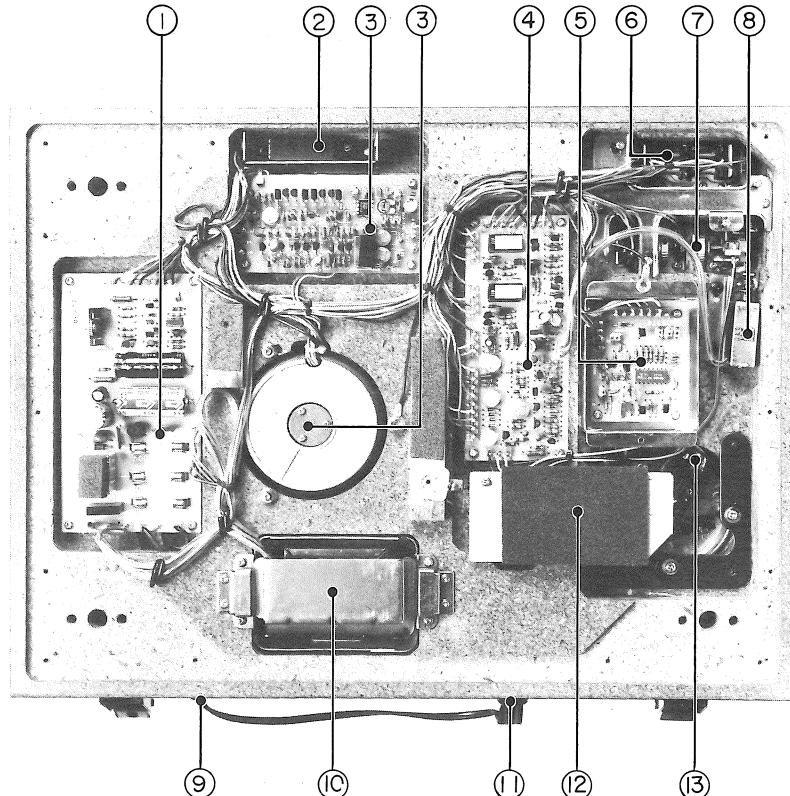

<b>Auto-Up Stop</b>	Non-contact photo-electric speed detector, linked with cueing lever and power OFF switch.
<b>Headshell</b>	Diecast aluminum alloy (interchangeable to EIA specs: weight 11 g)
<b>Possible Cartridge Weights</b>	4 ~ 16 g (with headshell provided)
<b>Output Leads</b>	Gold-plated plugs fitted, using NEGLEX type wire

### GENERAL

<b>Power Supplies</b>	120V/60Hz (US. and CANADA) 240V/50Hz (UK. and AUSTRALIA) 110, 130, 220, 240V/50, 60 Hz (EUROPE and General export models)
<b>Power Consumption</b>	10 W
<b>Cabinet</b>	High density coniferous particle board with black polyurethane open-pore decorative paint finish
<b>Dust Cover</b>	Acrylic
<b>Hinges</b>	Free-setting, detachable
<b>Acoustic Insulators</b>	Large double-type insulators, with adjustable height.
<b>Dimensions (W x H x D)</b>	470 x 163 x 378 mm (18-1/2" x 6-1/16" x 14-7/8")
<b>Weight</b>	16 kg (35 lb 4 oz)

Specifications subject to change without notice.

## APPELLATION OF PARTS (The photo depict the UL model)

- ① Power C. Board
- ② Stroboscope
- ③ Motor & Motor C. Board Assembly
- ④ Control C. Board
- ⑤ PL. C. Board
- ⑥ LED C. Board
- ⑦ Control Block
- ⑧ Solenoid Plunger
- ⑨ AC Cord
- ⑩ Power Transformer
- ⑪ Output Cord
- ⑫ Shield Plate
- ⑬ DET. C. Board

## ■ DISASSEMBLY PROCEDURES

Before disassembling the unit, remove the platter and cartridge, and securely tie the arm to the arm rest with string, etc. Then, gently turn the unit upside-down and place it on books, etc. piled up on both sides to protect the arm and cabinet from damage.

### 1. Rear Panel Removal

Remove 16 screws and washers, then take the rear panel out.

### 2. Tonearm Removal

Remove the shield plate by unscrewing two screws (Photo 1) and also, remove six lead wires (see color code in Photo 1), DET printed circuit board and lifter wire. Here, it is recommended to remove the lifter wire from the controls section rather than from the arm section. Finally, remove three sets of screws, S-washers and flat washers, all securing the tonearm assembly.

**Note:** When the arm assembly is reattached, re-adjustment of the auto-return position is needed (see "ADJUSTMENTS"). Therefore, do not dismantle the arm assembly unless required.

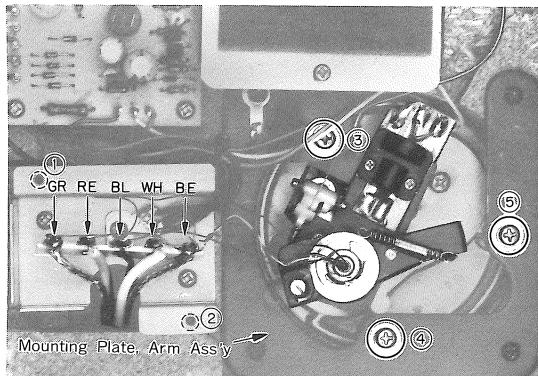

Photo. 1

### 3. Controls Removal

#### 3.1 Removal of switch mounting board

Take off the screws ① to ⑥ shown in Photo 2. This condition is shown in Photo 3.

#### 3.2 Removal of switches and variable resistors

Remove screws ① to ⑥ and hexagonal supports ⑦ to ⑩, shown in Photo 3. Now you can remove the respective parts. Here, be careful not to remove screws other than the above.

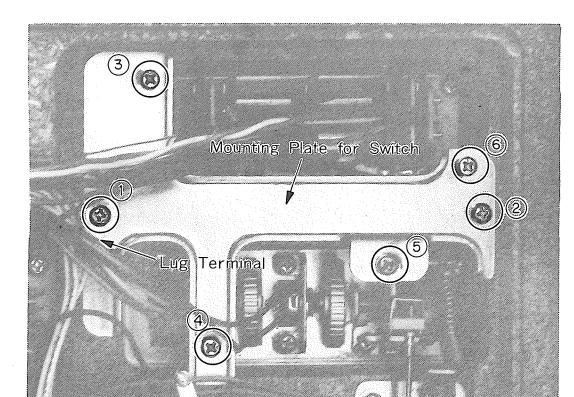

Photo. 2

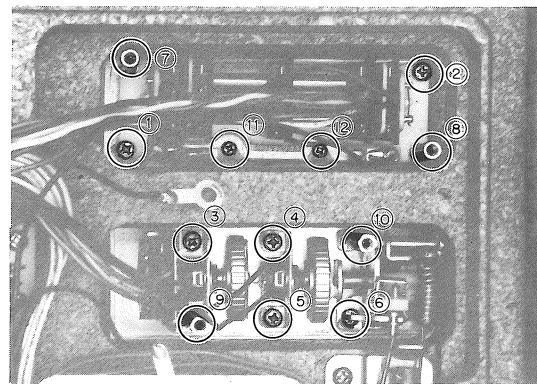

Photo. 3

### 4. Motor Removal

Remove the motor-shielding board from the cabinet surface first and unscrew ① to ③ securing the motor shown in Photo 4. After that, remove the motor together with the motor-mounting board without disconnecting 15 lead wires connected to the copper-plated side of the motor-mounting board, since the motor and the motor-mounting board are monolithically assembled.

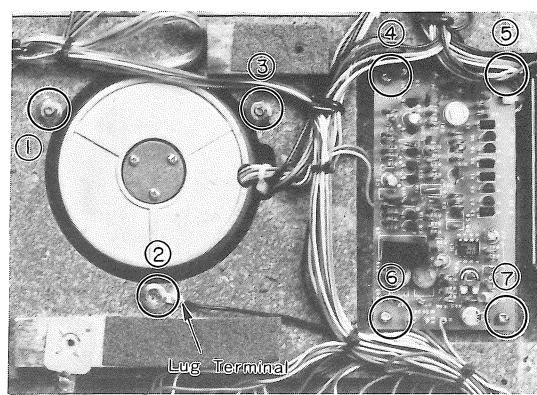

Photo. 4

## ■ADJUSTMENTS

### 1. Circuit Board Adjustments

#### ■ PL Circuit Board

Oscillating-frequencies check (4.32MHz): Connect a frequency counter to the collector of TR302.

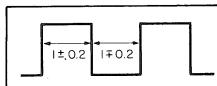

#### ■ Motor Circuit Board (PLL R.P.M adjustment)

Among adjusting points of the motor circuit board, VR1 and VR4 require exclusive jigs for adjustment. They are, however, completely pre-adjusted before shipping. So, never touch or adjust them; otherwise the performance will be deteriorated or normal functions will not be achieved.

[VR2] ..... 45 rpm

[VR3] ..... 33-1/3 rpm

Connect an oscilloscope between PD and E terminals of the control circuit board. Next, turn on the PLL switch and SPEED SELECTOR switch (33/45). Finally, adjust VR2 (45 rpm) and VR3 (33-1/3 rpm) so that they are stabilized when the duty ratio of square wave on the oscilloscope is  $1 \pm 0.2$ .

#### ■ Control Circuit Board (FG rpm adjustment)

Be sure to make this adjustment after completion of motor circuit board adjustment.

[VR202] ..... 33-1/3 rpm

[VR203] ..... 45 rpm

Set the PLL switch to OFF FG (Frequency Generator) position, and set the fine adjustment knob, located in controls section, to the center of the variable range. Then, turn on the SPEED SELECTOR switch (33/45). Finally, adjust VR202 (33-1/3 rpm) and VR203 (45 rpm) by rotating so that movement of the strobo markings stops.

#### ■ Control Circuit Board (auto-return adjustment)

[VR206] ..... CdS bias voltage

Connect a DC voltmeter (with input impedance of not less than  $100\text{ k}\Omega$ ) between CdS and 1+ terminals of the control Circuit Board. And turn on the SPEED SELECTOR switch (33/45). (The arm is positioned on the arm rest.) Fully turn VR206 clockwise, then turn it back counter-clockwise until the voltmeter reads  $10 \pm 0.2\text{ V}$ .

[VR205] ..... Return point adjustment

After adjusting the mechanism, adjust VR205 while monitoring the output when the test record ES-1008 (NEC) is played.

1. Adjusting the return point (3mm pitch grooves on the first side of the test record).

Fully turn VR205 clockwise, then descend the cartridge onto the outside (count of 10 or less of the 3mm pitch grooves of the test record).

After that, turn VR205 counter-clockwise so that the arm automatically ascends at count of

15 to 21. If this adjustment cannot be achieved at one time, repeat it for complete adjustment.

#### 2. Confirming the non-action of the arm (1mm pitch grooves on the second side of the test record)

Confirm that the arm does not automatically ascend at count of 21 or more after the cartridge is lowered on the outside (count of 10 or less) of the 1mm pitch grooves of the test record. If the arm automatically ascends, make readjustment according to Item 1 "Adjusting the return point".

### 2. Mechanism Adjustment

(Positioning of the sub-arm assembly)

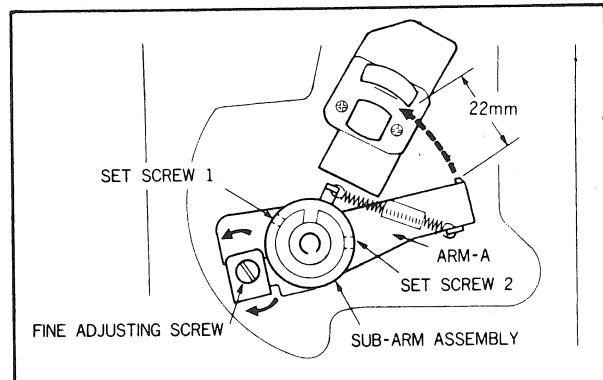

When the sub-arm assembly is removed for replacement of the arm, etc., the following adjustment will be required thereafter.

#### ■ Rough adjustment (Attaching the sub-arm assembly)

With the tonearm locked on the arm rest, tighten the set screws so that the distance between the lamp holder and sub arm is 22 mm as illustrated below. Here, previously set the sub arm near the center of the adjustable range by means of the fine adjustment screw. Tighten the set screw 1 first and tighten the set screw 2 after turning the sub arm A clockwise, using a hexagonal wrench for M3 (1.5 mm dia.)

#### ■ Fine adjustment (Setting the end groove position)

This fine adjustment is made while monitoring the voltage between CdS and 1+ terminals of the control circuit board. After setting VR206 (see "Circuit Board Adjustments"), move the tonearm so that the stylus tip is positioned at a distance of 53.2 mm from the center shaft — that is, the final groove on a template attached. Then, after having fully turned the fine adjustment screw for sub arm assembly clockwise, rotate it counter-clockwise so that the voltage between CdS and 1+ terminals becomes  $5.0 \pm 0.1\text{V}$ . Use a voltmeter with input impedance of  $100\text{ k}\Omega$  or more.

## ■ OUTLINE OF CIRCUITS

### ■ Quartz-Oscillating PLL Control

In conventional FG (Frequency Generator) servo control system, a Frequency Generator built into the motor induces a frequency proportional to the turntable speed. Feedback is introduced to keep the Frequency at a constant value. Stability against load fluctuations, however, is restricted since the feedback value is limited. Furthermore, when the turntable speed is controlled by a strobo synchronous with the power frequency, accuracy of the speed is limited to that of the power frequency (instantaneous variations  $\pm 0.5\%$ , normal  $\pm 0.2\%$ ). On the contrary, this unit's PLL (Phase Locked Loop) control system is a servo system that is designed to reduce the phase difference between FG frequency and a quartz-oscillating frequency by means of feedback gain. As a result, accuracy of turntable speed can be improved up to that of the quartz-oscillating frequency (0.002%). Also, this PLL control system is, in principle, unaffected by DC load changes — for instance, changes in tracking force. (In case of the YP-D10, tracking force is ineffective up to about 120 g, and the friction factor is 0.3 under load at the extreme outside groove).

The PLL control system is active when the phase difference between frequencies is within  $\pm 180^\circ$ , it does not work when the phase difference is over  $\pm 180^\circ$  since this cannot be detected. To cope with this disadvantage, the FG servo system is employed simultaneously.

Generally, the PLL control system hardly responds to dynamic load variations (disturbance torque), but well responds to extremely slow load variations. For load variations to which the PLL cannot respond, the FG servo system is effective. Moreover, inertia torque of the turntable (350 kg-cm) absorbs higher speed load variations (wow and

flutter).

### ■ Elements of PLL

The PLL circuit consists of five transistors and one IC on PL printed circuit board, which is housed in a shielded case to prevent radio interference. The PLL consists mainly of a reference frequency oscillating circuit, a phase comparing circuit, low pass filter and VCO (Voltage-controlled oscillator). In this unit, the FG motor serves as VCO.

By dividing the quartz-oscillating frequency of 4.32 MHz, the reference frequency is adjusted to match the frequency (100 Hz/33 rpm or 135 Hz/45 rpm) from the FG motor. After that, if a phase difference is observed when both frequencies are compared, a corresponding DC voltage will be induced. The output derived from the phase-comparing circuit contains the input frequencies (100 and 135 Hz). Therefore, only direct currents are derived through low-pass filters (R309, C310/R231, and C206).

Those direct currents control a motor drive circuit, and the motor oscillates at a frequency corresponding to its speed. Accordingly, a loop system whose frequency is compared with the reference frequency is repeated infinitely. Thus, an extremely stable speed which is synchronous with the reference frequency can be always obtained.

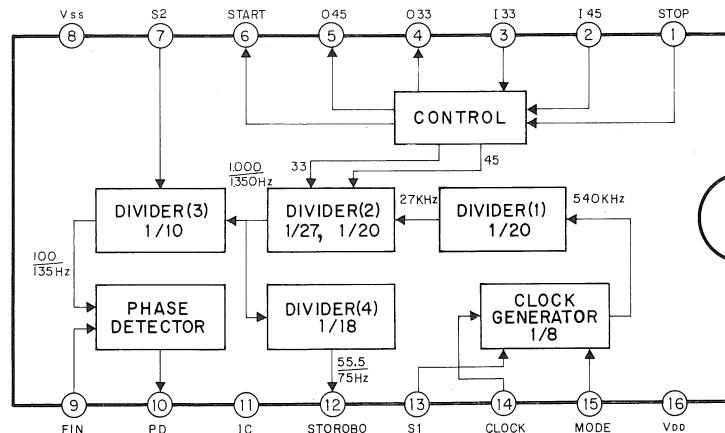

### ■ IC YM27500 for PLL

Shown below is the block diagram of YM27500.

#### IC REPLACEMENT NOTE

The YM27500 is a MOS type IC which has high input impedance at each port, so that there is danger of electrostatic damage when terminals are left open. When replacing the IC, previously provide grounding of serviceman himself and metal portion of the soldering iron.

YM 27500 (YAMAHA) 16 pin Ceramic Dual-in-Line)

**BLOCK DIAGRAM****■ Non-contact Photo-electric Detection****Auto Stop**

The YP-D10 employs a photo-electric detection auto stop mechanism that detects the end groove of the record, lifts the arm and simultaneously turns off the power.

In the end groove detection mechanism, a shutter interlocked with the arm is inserted between LED and CdS. This shutter serves to block light between

LED and CdS. At this time, the speed of the shutter is detected to actuate electric circuits which operate the cueing lever through a solenoid plunger. Thus, this non-contact photo-electric detection system poses no load to the arm and has no adverse effect on tracking ability. Shown below is a block diagram of the non-contact photo-electric detection system.

**[Start]**

When the switch 33 or 45 is pressed, a microswitch turns on the primary side of the power transformer, and current flows to the circuits. At the same time, another microswitch functions in the control block of IC301 (see the block diagram on the preceding page) to select the speed and to turn on TR111 and TR212. As a result, a relay (RY101) actuates, and the primary side of the power transformer remains in ON condition.

When the power source circuit is turned on, current momentarily flows into C203 on the control circuit board to actuate a flip-flop circuit which holds TR205 in ON condition and TR204 in OFF condition.

**[Detection Circuit]**

When the stylus tip approaches the end of the record, the shutter interlocked with the arm (sub arm) inserts between LED and CdS to change the amount of light which is radiated to CdS. Therefore, the resistance value of CdS increases. When the stylus tip traces the inside grooves with rough pitches (4 to 9 mm - JIS) after the end of play, the resistance of CdS changes rapidly. The resistance of CdS determines the base voltage of TR201, changes in the resistance appear at the emitter of TR201 (emitter follower) and are transmitted to the gate of FET202 through C202.

C202 and R206 constitute a differentiation circuit. This means the higher the change speed, the shorter the rising time and the higher the trigger wave height. Thus, the end of the record can be detected by means of the inside rough pitch grooves.

**[Discriminating Circuit]**

VR205 (see Item "ADJUSTMENT") delivers the bias voltage to the emitter of TR218 to discriminate whether the waveform of currents from the detection circuit is caused by rough pitch grooves or not. This discriminating circuit actuates when groove pitch is 3 mm or more, and prevents erroneous operation due to eccentricity of the record (loose fit between the center shaft and record hole). Only the waveform above the Zener voltage of the inverse-connected D221 can pass the discriminating circuit.

**[Hold Circuit]**

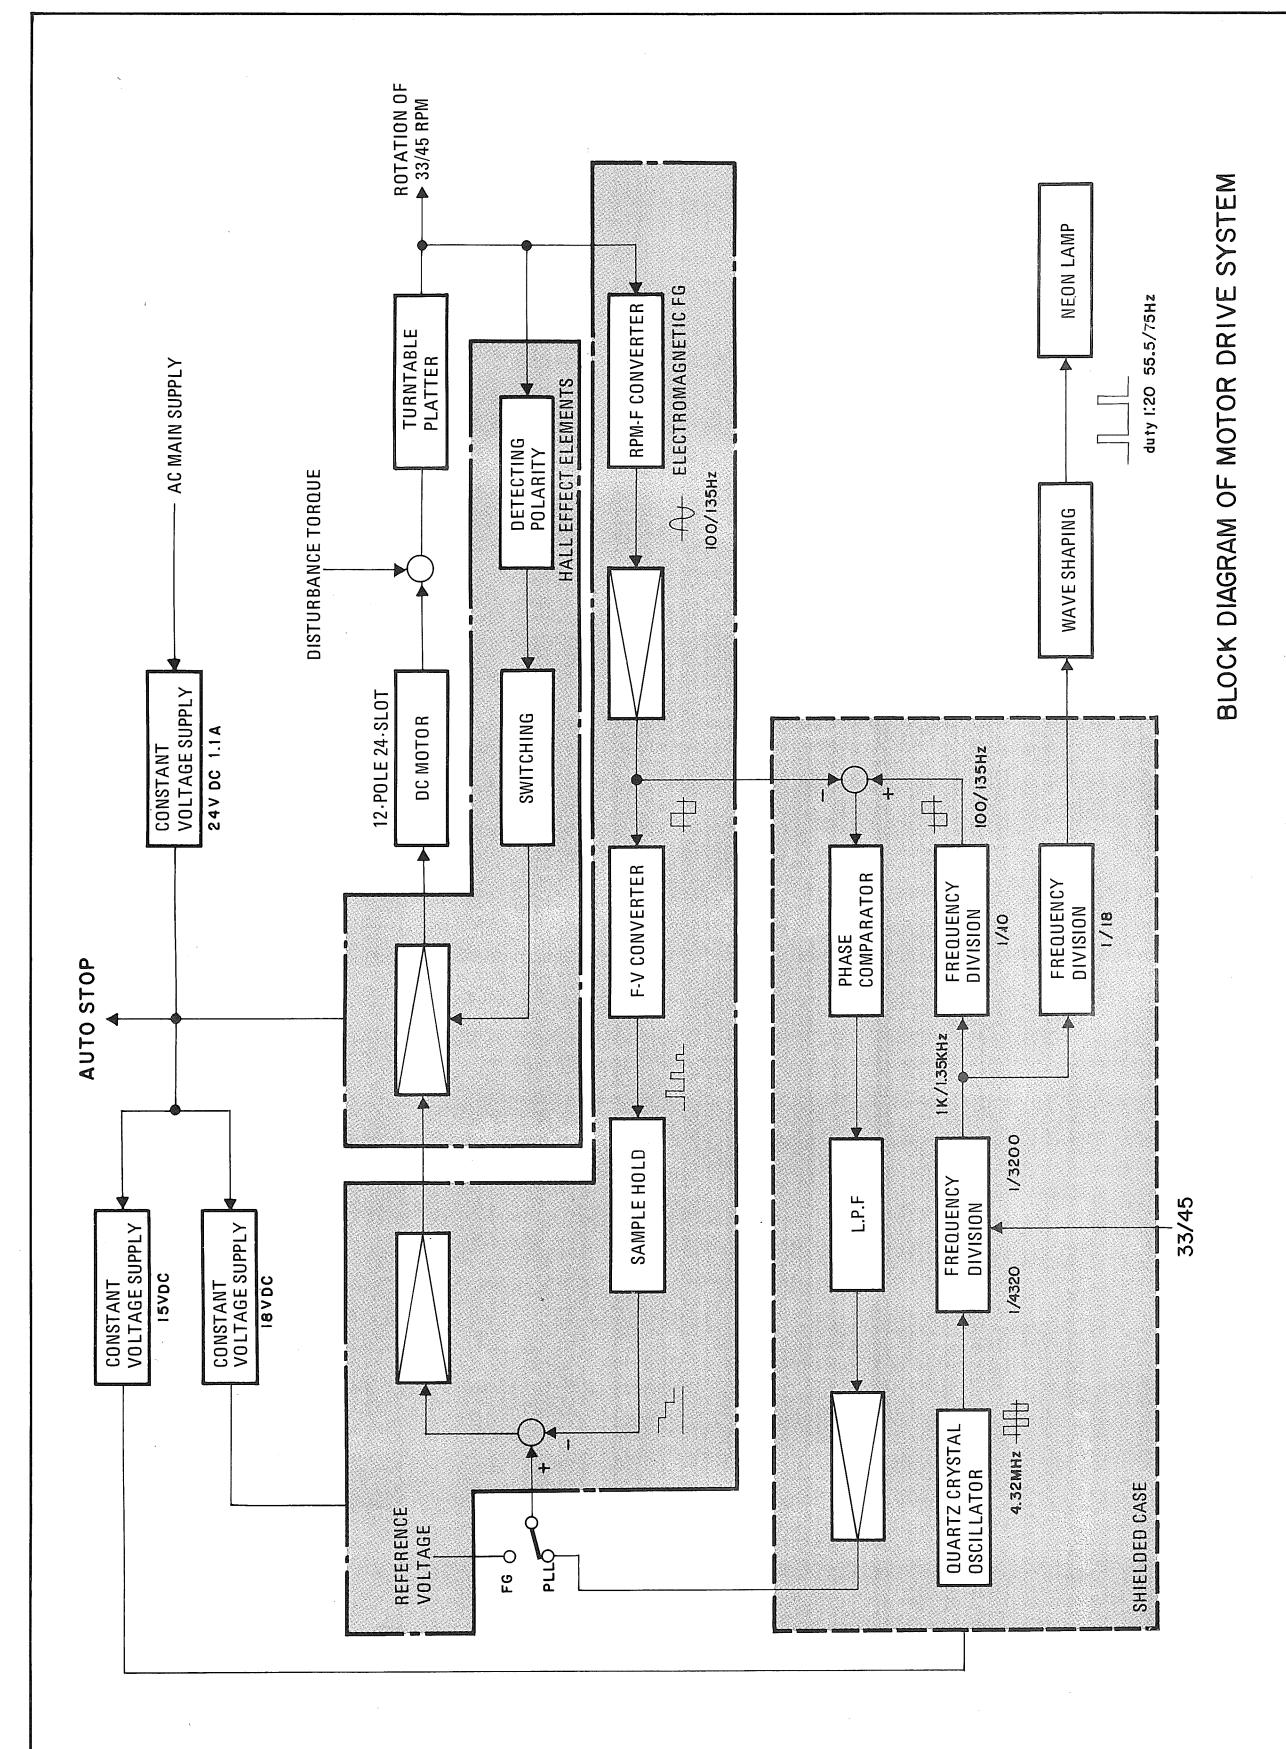

This hold circuit holds TR205 in ON condition and TR204 in OFF condition when the power is turned on. When the pulse that passes D221 is transmitted to the base of TR204, the hold circuit is inverted.

**[Switching Circuit]**

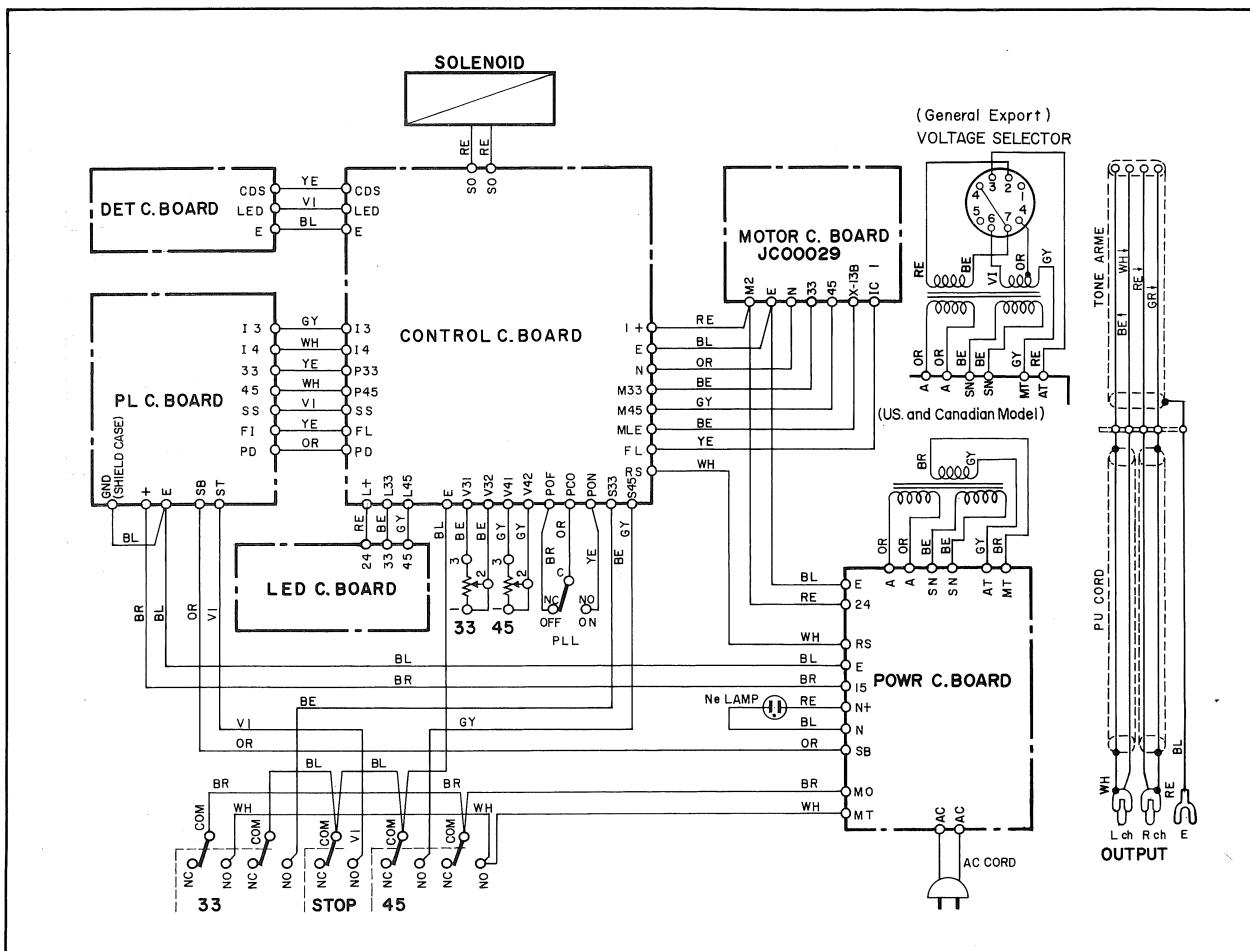

At the moment when TR205 is turned off, the rising portion of the voltage passes through C212, which turns on TR219 and TR206. As a result, the solenoid plunger is actuated to operate the cueing lever. Thus lifting of the arm is completed.

**[Delay Circuit and Relay Off Circuit]**

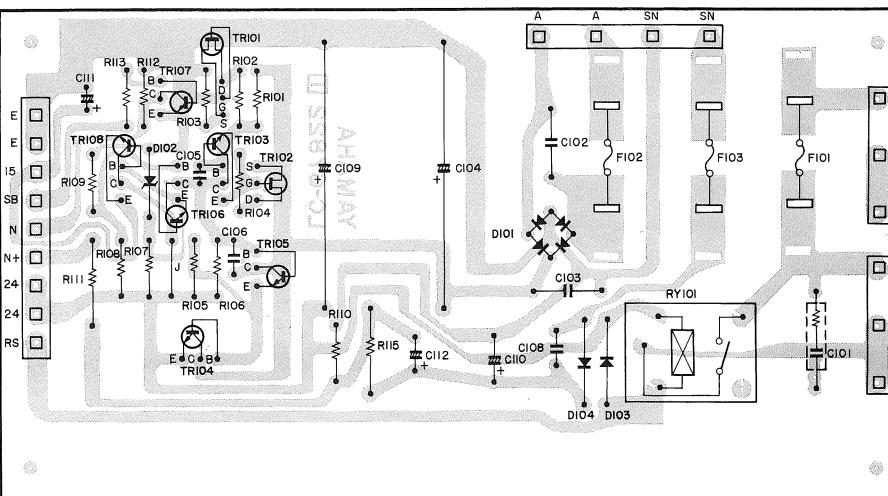

The pulse that drives the solenoid plunger is simultaneously delivered to a delay circuit consisting of R217 and C211. After a lapse of time until the action of the plunger is completed, switching is made to TR207, TR209 and TR210. As a result, the base voltage of TR211 becomes zero, and the relay RY101 is switched off. This turns off the power switch interlocked with the relay. Now the circuitry is completely shut off. (Refer to the attached schematic diagram.)

## POSITIONING OF THE SUB-TONEARM

### ■ FINE ADJUSTMENT

This fine adjustment can be made by regulating voltage between terminals of CDS and 1+ on the Control circuit board. After completion of setting VR206 (see Item "Electrical Adjustment—Control Circuit Board Adjustment").

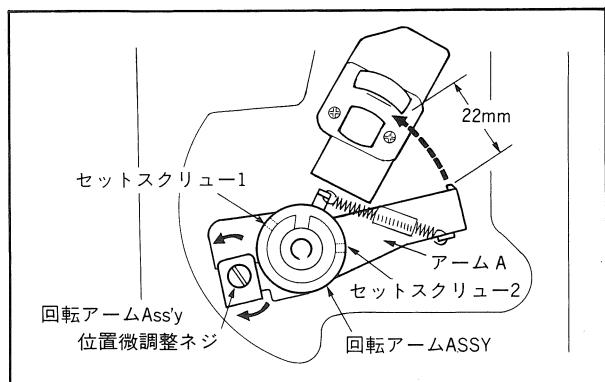

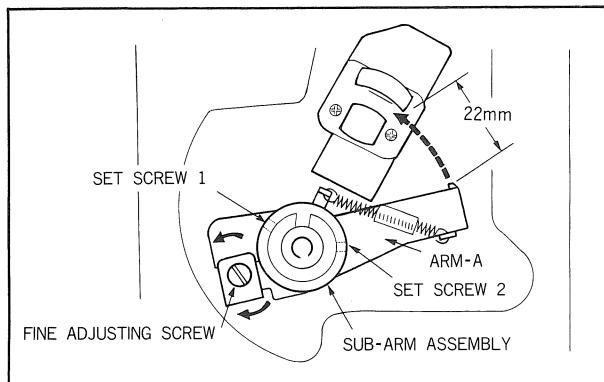

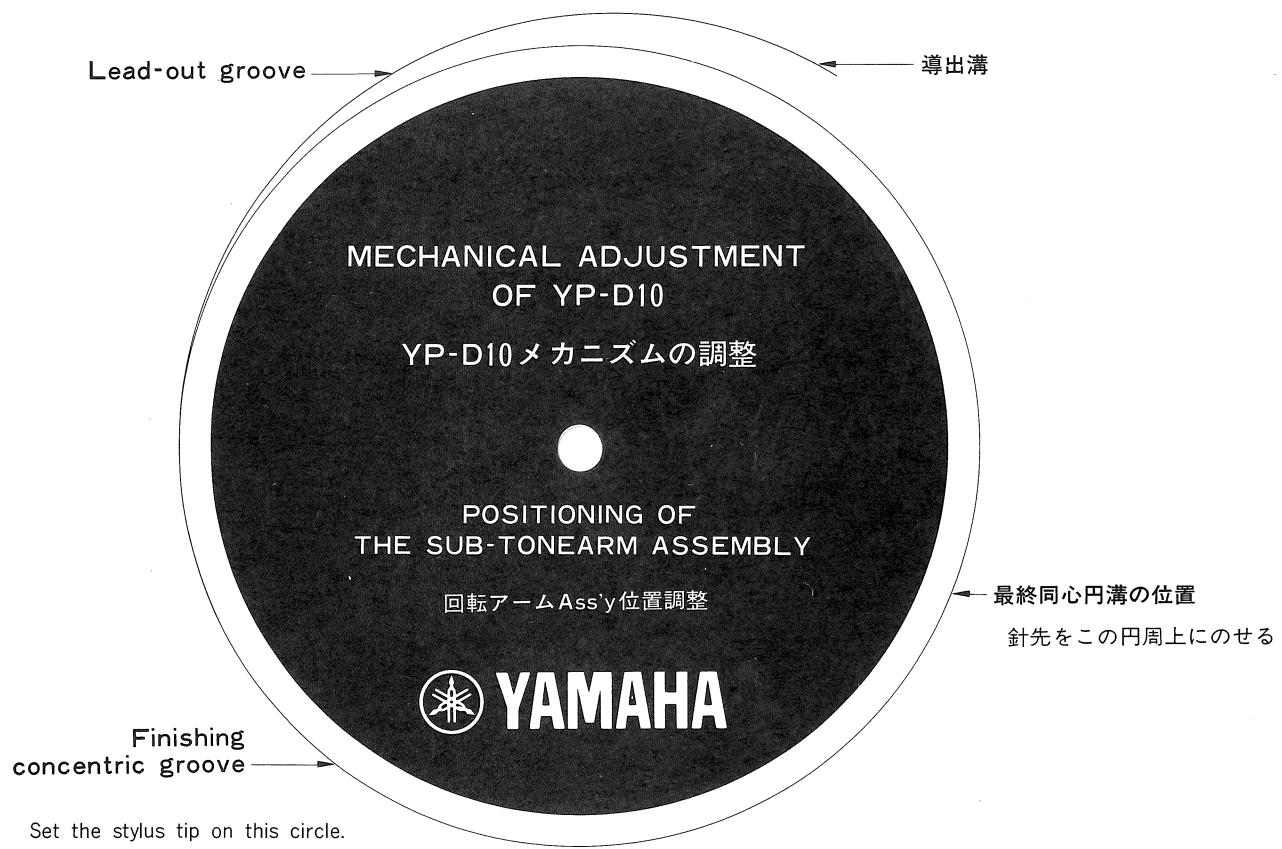

Position the stylus-tip of the tonearm at distance of 53.2mm (2-3/32 in.) from the center shaft, which is just on the finishing concentric groove of the record, and also indicated on a template provided.

Here, fully turn clockwise the fine adjustment screw for positioning the sub-tonearm assembly, then turn it counter-clockwise until voltage between CDS and 1+ becomes  $5.0 \pm 0.1$  volt, using a voltmeter with input impedance of not less than  $100k\Omega$ . REFER TO 5 PAGE

### 回転アームAss'y位置調整

#### ■微調整（最終溝位置調整）

微調整は、コントロールシート、CdS、1+端子の電圧を測定しながら行ないます。VR206（シート調整の項参照）のセッティングが完了したのち、トーンアームを移動し、針先位置がセンターシャフトから53.2mmにしたとき、回転アーム Ass'y 位置微調整ネジを右(時計方向)に回わしきった状態から、左(反時計方向)に回わしていくと、CdS、1+端子間の電圧(入力インピーダンス $100K\Omega$ 以上の電圧計使用)が、 $5.0 \pm 0.1$ Vになるようにします。本文5ページ参照
