Alignment

ALIGNMENT PROCEDURE FOR THE LASER CURRENT AND THE FOCUS OFFSET (RCD-955AX)

NOTE 1. This alignment must be done only if or the monoboard or the CDM is replaced for service purpose.

NOTE 2. The given measurement date are only for alignment after service. When checking monokits for these date, different values can be found. This is normal and gives no reason for malfunction.

NOTE 3. The used test disc must be a SONY type 4 (YEDS 18).

A. Turn used laser variable resistor R108 in a position that the total resistance of R108 plus R109 is 1 kohm.

Turn the focus variable resistor R129 in the middle position.

B. Switch the power ON and verify that the display light up.

C. Place the test disc in the tray. The test disc must be clean (no finger prints) and may not be damaged.

D. Connect a DC voltmeter over resistor R101, switch the power on, press the PLAY button and check the reading of the DC voltmeter.

E. While the monokit is playing, adjust the laser current with variable resistor R108 at a value of 50 mV +/– 2 mV.

F. Switch the power off and connect a DC voltmeter over capacitor C133, switch the power on, press the PLAY button and check the reading of the DC voltmeter.

G. While the monokit is playing, adjust the focus offset with variable resistor R129 at a value of 400 mV +/– 20 mV.

REMARK: It is normal that the focus readout is not stable, but is varying within certain range.
